

Since WT&L began using FMS, erroneous data has been reduced by 50-75%, and the time spent correcting faulty data has been reduced by 90%.

Previously, the WT&L system was at least one hour behind and was unusable for up to 30% of the time due to system uploads. With FMS, WT&L suffers no slowdown and all uploads run continuously in the background with no interruption to service. Most importantly, reported updates by carriers now appear in near real time.

RMI's e-BOL provides a single portal to enter and manage Bills of Lading for all of WT&L's customers and carriers. This standard system uses repetitive patterns and simplified data entry, which has resulted in a 75% time savings and greater quality control. Using RMI systems, WT&L collects close to 100% of all waybills requested, more than doubling previous efforts.
